

Healthcare Job Market Analysis

Key Findings Summary | Created By: Nikhil Edouard | July 22, 2026

Problem Statement

Healthcare organizations and job seekers alike lack clear, data-driven visibility into how demand, compensation, and required skills vary across healthcare operations and analytics roles. This analysis addresses three questions: (1) which job titles have the highest posting volume and where are they geographically concentrated, (2) which skills appear most frequently in postings and which are associated with higher salary ranges, and (3) how salary ranges vary across role types and which roles offer the strongest compensation relative to posting volume. Answering these questions helps job seekers prioritize where to focus a search and which skills to build, and gives hiring teams an external benchmark for role design and compensation.

Methodology

The analysis draws on a Kaggle-sourced dataset of 123,842 LinkedIn job postings from 2023–2024. Cleaning was performed in BigQuery SQL: postings were filtered to verified U.S. healthcare operations and analytics roles using a three-condition company- and keyword-based filter, deduplicated on job ID (44 duplicates removed), and salary fields normalized to an annualized basis across hourly, weekly, biweekly, and monthly pay cadences, with outlier bounds of \$30,000–\$500,000 applied. Location fields were parsed into city and state, and job titles were categorized into five role groups and 13 functional title groups using keyword-based logic. The resulting analytical dataset totals 2,854 postings, of which 790 (27.7%) include salary data and 2,349 (82.3%) include valid state-level location data. Skill frequency was derived via Python keyword extraction: 34 keywords spanning technical, healthcare domain, and operational categories, applied to job descriptions using regular-expression, word-boundary matching. Visualizations were built in Power BI. Full SQL queries and the Python notebook are available in the project GitHub repository.

Key Findings

Geographic Concentration

Nearly one-third of all healthcare operations and analytics job postings (32.8%) are concentrated in four states: California, Texas, New York, and Florida. Candidates open to relocation to these markets have access to significantly more opportunities than those limited to other geographies.

Market Fragmentation by Title

The market is highly fragmented: no single job title accounts for more than 1% of postings, and most titles appear fewer than 10 times in the dataset. This reflects the diversity of functional roles within healthcare operations rather than convergence around standardized titles common in other industries.

Compensation by Role Category & Function

Manager-level roles command the highest average compensation among role categories at approximately \$114,800 annually, compared to \$61,400 for Coordinator roles, a roughly \$53,000 premium tied to

management responsibility. Viewed by functional area, Clinical Operations leads at approximately \$118,300, while Coordinator remains the entry point at \$57,000, a \$61,000 spread. Clinical operations, management, and analytics functions consistently outperform administrative coordination roles.

Geographic Role Distribution

Among states with sufficient volume (30+ postings), Management, Clinical Operations, and Coordinator roles appear among the top three most-posted titles across the majority of high-volume states, indicating these functions represent stable, nationally distributed demand rather than regionally concentrated hiring.

Demand vs. Compensation

Manager and Other roles dominate demand: Manager postings alone (232) outnumber all other named categories (Analyst, Consultant, and Coordinator), with Analyst the next closest at 79. Demand and compensation are not strictly linear, however: Consultant is the lowest-demand category (60 postings) yet commands an average midpoint salary of approximately \$102,900, outearning the higher-demand Analyst and Coordinator categories. This premium likely reflects specialized expertise and advisory value, suggesting scarcity of supply, not volume of demand, is the stronger driver of compensation at the role-category Level.

Most In-Demand Skills

Excel is the single most frequently mentioned skill, appearing in 20.8% of postings, a baseline expectation rather than a differentiator. Of the top 10 skills overall, 2 are technical tools, 6 reflect healthcare domain knowledge, and 2 are operational competencies, indicating employers prioritize domain expertise over any single technical tool.

Rank	Skill	Category	% of Postings
1	Excel	<i>Technical Tools</i>	20.8%
2	Medicare	<i>Healthcare Domain</i>	18.6%
3	Medicaid	<i>Healthcare Domain</i>	15.3%
4	Claims	<i>Healthcare Domain</i>	11.8%
5	Project Management	<i>Operational Skills</i>	10.9%
6	HIPAA	<i>Healthcare Domain</i>	10.0%
7	Revenue Cycle	<i>Healthcare Domain</i>	9.5%
8	Process Improvement	<i>Operational Skills</i>	6.9%
9	CMS	<i>Healthcare Domain</i>	5.2%
10	Epic	<i>Technical Tools</i>	5.2%

Recommendations

- **For job seekers:** Prioritize California, Texas, New York, and Florida if open to relocation, these four states account for nearly a third of all postings and offer the deepest candidate pipelines.
- **For skill development:** Excel appears in roughly 1 in 5 postings and functions as a baseline expectation rather than a differentiator. Candidates should prioritize depth in healthcare domain knowledge (Medicare, Medicaid, claims, HIPAA, and revenue cycle) and pair it with a specialized tool such as SQL or Epic, since domain expertise outweighs any single technical skill in this market.
- **For career positioning:** Manager-level and Clinical Operations roles carry the largest average compensation premiums, but the Consultant category shows that scarcity of specialized expertise can command a comparable premium even at low posting volume. Candidates should weigh niche specialization as a viable path to compensation growth, not only high-volume, high-visibility titles.
- **For employers and hiring teams:** The fragmented title taxonomy observed here suggests an opportunity to standardize role titles and leveling internally, which would improve pipeline clarity for candidates and make compensation benchmarking against the external market more reliable.
